

How to convert WebGL1.0 compatible code to WebGL 2.0:

- 1) add ***#version 300 es*** to the first line of both shaders
- 2) a) In shader codes, start input variables with ***in*** and output variables with ***out***
b) change *gl_FragColor* to an output variable

```
const vShader = `
    attribute vec4 a_position;
    attribute vec4 a_color;
    uniform mat4 u_matrix;
    varying vec4 color;
    void main() {
        gl_Position = u_matrix *
a_position;
        color = a_color;
    }
`;
```

```
const vShader = `#version 300 es
    in vec4 a_position;
    in vec4 a_color;
    uniform mat4 u_matrix;
    out vec4 color;
    void main() {
        gl_Position = u_matrix *
a_position;
        color = a_color;
    }
`;

const fShader = `#version 300 es
    precision mediump float;
    varying vec4 color;
    void main() {
        gl_FragColor = color;
    }
`;

const fShader = `#version 300 es
    precision mediump float;
    in vec4 color;
    out vec4 fcolor;
    void main() {
        fcolor = color;
    }
`;
```

- 3) instead of *gl = canvas.getContext("webgl");*
use ***gl = canvas.getContext("webgl2");***
- 4) if you have *requestAnimFrame(render);* change it to ***requestAnimationFrame(render);***
