Sinan Ermiş 2220356143 - Berkay Saylak 2210356085

1. BUSINESS DESCRIPTION

The business is called Irish Luck and operates as a **pub-restaurant** that offers food and beverage services. It opens in the afternoon and operates until around midnight (1 AM). The business has been active since September 2019. The industry is the food & beverage sector.

2. BUSINESS PROCESS UNDER STUDY

The company uses a table service model for order reception. They do not offer delivery service. The order reception process is as follows:

1. **Table Activation:** When a customer arrives, a staff member uses the **Pionpos application** to activate the table, logging the table number and the number of guests.
2. **Order Taking:** The server takes the customers' requests at the table.
3. **Order Entry:** The server enters the requested items into the Pionpos application via their **personal mobile phone**. Items are selected from the appropriate categories in the digital menu.
4. **Order Routing (Automated):** The system automatically prints out separate chits (tickets) for the different service areas:
 - **Bar:** For beverage orders.
 - **Kitchen:** For food orders.
5. **Service:** The orders are prepared and served to the table.
6. **Checkout/Payment:** When the customer is ready to pay, the check is processed using the Pavo POS device.

3. SUPPORTING INFORMATION SYSTEM

The business's supporting information system revolves around the **Pionpos application**, which serves as the core software. Pionpos is a proprietary, affordable, and user-friendly application developed by external entrepreneurs. The system relies on several devices and components:

- **User Devices:** Every employee uses their mobile phones to log in, which acts as the main point of sale for taking orders directly at the table.
- **POS Device:** The dedicated payment terminal is the **Pavo POS device**. This device is compatible with Pionpos, runs on its own internet connection (via SIM card), and is primarily used for processing payments and checkout.
- **Printing/Output:** A computer must remain active as it functions as the server for the printers. This setup is necessary to print the required kitchen and bar chits for order preparation.
- **Communication:** The entire system is networked, enabling real-time communication between the mobile phones, the Pavo device, and the computer/printers.
- **Additional Services:** Pionpos also features an integrated **QR menu system**. Any menu update made within the Pionpos application is instantly reflected on the customer-facing QR menu.

4. DETAILS OF USING INFORMATION SYSTEM IN THE BUSINESS PROCESS UNDER STUDY

The Pionpos system is essential to virtually every step of the defined business process:

- **Order Taking & Entry:** Waiters use the application on their mobile phones to take and instantly enter customer orders at the table. This eliminates the need for manual writing on paper or memorizing complicated orders, which previously led to frequent errors (a major reason for switching from the old system).
- **Order Routing:** The system automatically categorizes and routes the orders to the appropriate service stations (Bar or Kitchen) by printing separate chits. This ensures efficiency and accuracy in preparation.
- **Table Management:** The system supports table activation and monitoring, keeping track of active tables and the number of guests.
- **Payment Processing:** Although orders are taken on mobile phones, the Pavo POS device is primarily used for the final checkout process.
- **End-to-End Management:** Beyond just ordering, Pionpos is used for:
 - **Accounting/Reporting:** Tracking all accounting data, generating expense reports, calculating profit, daily/weekly sales, and individual waiter sales performance.
 - **Inventory/Recipe Management (If entered):** It can track ingredient usage (e.g., amount of rum used per cocktail) if recipes are fully entered, allowing for accurate cost and inventory control.

5. RATIONALE FOR TRANSITION TO CURRENT INFORMATION SYSTEM

The decision to switch from the old system (which relied on the PC-based **Rop application** and the Ingenico POS device) to the mobile-friendly **Pionpos system** was really about escaping a frustrating cycle of mistakes and delays. The previous setup was a clumsy mix of manual and digital processes that caused major headaches.

The business needed a change because the old way of doing things was holding them back. For starters, staff frequently made order errors. Waiters had to scribble orders down on paper or notes before rushing to the central computer to manually key them in. That extra step was a prime source of mistakes, especially when the pub was slammed.

Then there was the issue of wasted time. Since Rop was stuck on a single PC, when things got busy, staff had to queue up to enter their orders. This congestion meant annoying delays for both the servers and the customers.

The system also made payment and tax calculation unnecessarily complex. Waiters were forced to manually separate and calculate items with different tax rates like 20% for alcohol and 10% for food when using the Ingenico terminal. This complicated process often led staff to simplify things by just using a single, incorrect rate, which resulted in headaches and VAT discrepancies.

Finally, something as simple as updating the menu was a huge chore. The pub used a separate vendor for their QR code menu. Changing a price or adding a new item meant updating Rop, then emailing all the details and pictures to the QR vendor, and waiting for them to finally make the change. Pionpos fixed this by integrating the menu and the QR code, allowing the staff to make instant, self-service updates.

By switching to Pionpos and letting waiters enter orders right at the table using their phones, the business directly solved all these crucial problems, achieving a huge jump in both efficiency and accuracy.

6. PROBLEMS OBSERVED DURING/AFTER THE TRANSITION

Surprisingly, the transition to the new Pionpos system was described as extremely smooth and without significant technical issues or resistance. The interviewee expressed relief, stating, "We were so happy... 'Why haven't we switched earlier?'"

The only minor friction point was the staff adjustment period, but even this was very short due to the staff's general familiarity with smartphone applications.

However, the interviewee noted one minor ongoing operational issue within the new Pionpos system itself: Inability to delete zero-priced items. The business runs promotions (like 5 beers in a bucket) which are entered into the system as "Campaign Beers" at a 0 TL price. If a server accidentally enters too many zero-priced items, or a customer changes their mind about an item before it's served, these zero-priced items cannot be deleted from the check. This makes inventory and consumption tracking difficult, especially when multiple servers handle the same table.

7. LESSONS LEARNED FROM THE TRANSITION

The biggest takeaway from the whole transition was realizing just how incredibly valuable mobile-first, user-friendly automation is for running the pub.

If the owner had the chance to design the ordering system all over again, or suggest improvements to the current one, they'd focus on a few key areas:

First and foremost, they would always prioritize user-friendliness. The mobile app's ease of use was a total game-changer, proving that investing in an intuitive design pays off by drastically cutting down on training time and costly mistakes.

Second, they'd strongly advocate for integrated solutions. The fact that Pionpos can handle everything from menu updates and accounting to order taking and all of that linked to the QR code is far superior to juggling the previous, fragmented systems.

Finally, they'd definitely push the developers to fix those tricky edge cases in the software. Specifically, the owner would insist on finding a way to delete those zero-priced campaign items from a check. That small flaw creates unnecessary headaches when trying to manage promotions and keep accurate consumption records.

8. BENEFITS OBTAINED BY THE TRANSITION

The move to the Pionpos system provided significant advantages by automating and integrating core processes:

- **Improved Accuracy and Reduced Errors:** Orders are entered directly at the table into the mobile device, **eliminating transcription errors** from paper to the computer.
- **Increased Speed and Efficiency:** Orders are routed **instantly and automatically** to the bar or kitchen printers. Waiters no longer waste time waiting at a central terminal to enter orders.
- **Seamless Tax/VAT Compliance:** The system is correctly configured to automatically apply the **different VAT percentages** for alcohol (20%) and food (10%), ensuring accurate compliance without requiring manual calculation by the staff.
- **Comprehensive Financial Reporting:** Pionpos acts as an **all-in-one management system**, providing detailed daily/weekly sales reports, expense reporting, profit calculations, and even waiter performance tracking.
- **Real-Time Menu Management:** Any change made to the digital menu is **instantly reflected on the customer-facing QR menu**, saving significant time and resources compared to the old system.
- **Better Inventory Control (Potential):** By entering product recipes (like cocktail ingredients), the system can precisely track consumption (e.g., how much rum was used from a liter bottle) against sales, though this depends on the owner fully utilizing this feature.
